What is NoveLA?

NoveLA is a free, GPL-3.0 licensed Android application for reading web novels, light novels, and ranobe. Built natively in Kotlin with Jetpack Compose and Material 3, it brings a modern, offline-first reading experience to fans of online fiction — pulling content from 35+ sources, with first-class translation, text-to-speech, and a Lua-based plugin system that lets the community add new sources without app updates.

The codebase is structured as 32 Gradle modules across four architectural layers, totaling roughly 54,000 lines of Kotlin. It runs on Android 8.0+ (API 26), targets the latest SDK 35, and is fully open to community contribution — bug fixes, new source parsers, and plugin submissions are all welcome.

Feature Highlights

Global Multi-Source Search

Search across all 35+ sources in parallel, or add any novel by URL. Results grouped by source for easy comparison.

In-Reader Translation

Four backends including Google and Gemini. Parallel mode shows original + translated side by side, no app switching.

Text-to-Speech

Floating mini-player, background playback, speed/pitch control, Bluetooth support, multiple engine support, reading timer.

Local EPUB & FB2 Library

Import local EPUB and FB2 books with bulk import support. Custom fonts, text size, light/dark Material 3 themes.

Lua Plugin System

External Lua-based source plugins installable directly in-app. Official repo: [HnDK0/external-sources](https://github.com/HnDK0/external-sources). Add new sources without app updates.

Cloudflare Bypass

Automatic Cloudflare Turnstile bypass. Regex text cleanup to strip injected ads. Novel migration between sources.

Four Translation Backends

Multiple API keys are rotated round-robin on rate limits. Parallel mode displays original and translated text side by side. Novel-specific prompts customize translation behavior per book.

Google Translate

ENHANCED

COST

Free

API KEY

Not required

Best default. Uses the enhanced Google translate endpoint with better context handling.

Google Translate

SIMPLE

COST

Free

API KEY

Not required

Lightweight classic endpoint. Faster, less context-aware. Good fallback.

Google Gemini

LLM

COST

Free tier

API KEY

Required

LLM-powered. Higher quality literary translation. Subject to Gemini free-tier quotas.

OpenAI-compatible

FLEXIBLE

COST

Varies

API KEY

Required

Accepts OpenAI, OpenRouter, DeepSeek, Ollama, Mistral, and any compatible endpoint. Most flexible.

◆ Parallel mode shows original and translated text side by side — no copy-paste, no app switching.

Lua-Based Plugin System

NovelA supports external Lua-based source plugins installable directly from within the app. The plugin runtime is powered by LuaJ 3.0.1, with YAML configuration via SnakeYAML 2.6. Sources are defined as declarative configuration — HTML selectors, JSON API mappings, pagination rules, filters — and the scraper engine handles the rest.

This means the community can add new sources without waiting for app updates. The official plugin repository is HnDK0/external-sources, but any compatible Git URL works.

- 1 Open Finder → Extensions in the app
- 2 Tap the  settings icon top-right
- 3 Paste the plugin repo URL and confirm

```
plugin_repo: https://github.com/HnDK0/external-sources
```

Layered Module Architecture

32 Gradle modules across 4 strict layers. Dependencies flow downward only — upper layers may depend on lower, never the reverse.

Module Breakdown by Layer

MODULES PER LAYER

32 Gradle Modules

+ 3 build-logic convention plugins

Tooling (12)

Persistence, TTS, translation, backup, EPUB parsing, novel migration, background workers. Pure logic, no UI.

Features (10)

One module per user-facing screen. Each owns its Activity, ViewModel, Composables, and state. Independently testable.

Core (6)

Shared foundation: app context, preferences, models, navigation, networking client, the scraper engine itself.

App (1)

The thin application shell. Wires Hilt graph, hosts MainActivity, glues all feature modules together via navigation.

Technology Stack

A modern, fully-native Android stack — Kotlin-first, Compose-driven, with carefully chosen libraries for networking, persistence, scraping, and extensibility.

Language & Runtime

Kotlin	2.0.21	Coroutines	1.9.0
KSP	2.0.21-1.0.28	kotlinx-serialization	1.7.3
Java	21		

UI Layer

Jetpack Compose	—	Material 3	1.3.1
Coil	2.7.0	Landscapist Glide	2.4.4
Material Icons Ext.	—		

DI & Async

Hilt	2.52	Hilt-Work	1.2.0
WorkManager	2.11.2	Coroutines	—
Lifecycle	2.8.7		

Data & Persistence

Room	2.8.4	OkHttp	5.0.0-alpha.14
Retrofit	2.12.0	Jsoup	1.18.1
Moshi	1.15.2	Gson	2.14.0

Platform & SDK

Android 8.0+	API 26	Compile SDK	35
Target SDK	35	Splash Screen	1.2.0
Navigation	2.8.4		

Specialty Libraries

LuaJ	3.0.1	SnakeYAML	2.6
Readability4j	1.0.8	Crux	5.1.0
MLKit Translate	17.0.3	Timber	5.0.1

All dependencies are pinned via a Gradle version catalog (gradle/libs.versions.toml). Convention plugins enforce shared config across every module.

Three convention plugins

APPLICATION

noveldokusha.android.application

Sets up signing, ABI splits, build types, proguard, namespace. Inherited by :app only.

LIBRARY

noveldokusha.android.library

Default Android library config: min/target SDK, Java 21, test scaffolding. Used by all 31 library modules.

COMPOSE

noveldokusha.android.compose

Adds Jetpack Compose compiler plugin, Material 3 deps, Coil, Glide, tooling. Used by feature modules with UI.

✓ com.autonomousapps.dependency-analysis plugin catches unused deps at build time.

Reader & Text-to-Speech

After all, his life was coming to an end.

Enjoying the warmth of the luxurious drink, he raised the cup and savored the aroma. Then, tentatively, he took a small sip... and immediately grimaced.

"Ah! So bitter!"

Giving the cup of coffee an intense look, Sunny sighed and forced himself to drink some more. Bitter or not, he was determined to get his money's worth — taste buds be damned.

"I should have bought a piece of real meat instead. Who knew actual coffee is so disgusting? Well. It's going to keep me awake, at least."

He stared into the distance, dozing off, and then slapped himself in the face to wake up.

"Tsk. What a rip-off."

Shaking his head and cursing, Sunny finished the coffee and stood up. Rich people living in this part of the city were rushing past the small park on their way to work, staring

READING EXPERIENCE

Infinite chapter scrolling

Continuous reading across chapter boundaries with prefetching.

Offline caching

Downloaded chapters stored locally for offline access.

Custom fonts & sizing

Built-in Inter, Lora, Merriweather, Source Sans Pro. Import your own.

Material 3 themes

20+ color schemes including Tachiyomi, Catppuccin, Nord, Monet, Mocha.

TEXT-TO-SPEECH

Floating mini-player

Persistent overlay with play/pause/skip controls while reading or in other apps.

Speed & pitch control

Fine-grained tuning. Multiple TTS engine support.

Bluetooth & background

Plays through paired devices. Survives screen lock and app switch.

Reading timer

Auto-stop TTS after a configurable duration for bedtime reading.

By the Numbers

A snapshot of the NoveLA repository — a substantial, actively-maintained open-source Android project.

NOVELA · GALLERY

высокопоставленным гражданам, стоила ему большей части сбережений.

Но именно в этот день Санны решил побаловать себя.

В конце концов, его жизнь подходила к концу.

Наслаждаясь теплом изысканного напитка, он поднял чашку и впитал аромат. Затем, неуверенно, он сделал небольшой глоток... и тут же поморщился.

"Ах! Какая горечь!"

Внимательно взглянув на чашку кофе, Санны вздохнул

INSTALLED PLUGINS

Current Status & Direction

STATUS — New features are temporarily paused. Current focus is on fixing bugs, cleaning up the codebase, and performance/optimization work. Bug reports and PRs targeting existing issues are very welcome.

IN PROGRESS

Bug Fixes & Cleanup

Stabilizing the codebase, removing dead code, improving tests, and addressing open issues. The optimization report ([NoveLA_Optimization_Report.md](#)) guides this work.

ACTIVE

Performance Tuning

Database query optimization, scraper caching improvements, Compose recomposition audits, and memory footprint reduction for large libraries.

WELCOME

Source Parser PRs

Fixes and improvements to existing source parsers are actively merged. New sources can be added via the plugin repo without app changes.

DEFERRED

New Feature Requests

New feature requests will be revisited later. The team prioritizes stability and codebase health over new functionality for now.

Want to help? Open issues, submit PRs, or contribute new Lua plugins to [HnDK0/external-sources](#).

Get NoveLA. Read Everywhere.

14

Three ways to engage with the project — pick yours.

Download

Get the latest APK from the GitHub Releases page.
Requires Android 8.0 or above. No account, no tracking, no ads — ever.

github.com/Parasgaming122/NoveLA/releases

Or build from source: git clone + Android Studio

Extend with Plugins

Add new novel sources in seconds. Lua-based plugins install directly from the app — no APK updates needed. Use the official repo or host your own.

github.com/HnDK0/external-sources

In-app: Finder → Extensions →  → paste repo URL

Contribute

Pull requests welcome. Fix source parsers, improve UI, optimize database, add translations. Open issues first for major changes.

github.com/Parasgaming122/NoveLA/issues
